

Enbridge's Climate Change Policy

Enbridge recognizes that there is growing evidence that climate change is a critical global issue. We also acknowledge that dealing with climate change is a shared responsibility with implications for citizens, governments and business. Enbridge is committed to being part of a collaborative solution: our climate change strategy focuses on reducing greenhouse gas emissions from existing operations, designing new facilities with a view to reducing emissions and on developing new renewable and alternative energy sources. This is in keeping with our overall commitment to protecting the environment, while enhancing our position as one of North America's leading sustainable energy delivery companies.

Actions undertaken in the past have contributed to addressing the climate change challenge through verifiable GHG reductions. Enbridge recognizes that meaningful GHG reductions will require governments to collaborate with industry and the consuming public to establish clear, realistic GHG emission objectives, and policies and regulations that will be effective in achieving them.

Enbridge believes that government must encourage GHG mitigation policies and regulations across all sectors of the economy, and involve both energy consumers and energy producers. Government policies must be tailored to our energy intensive and export-based economy, and must enable us to remain competitive while making meaningful reductions in GHG emissions. Policies should establish a defined price for CO₂ emissions and compliance options should focus on promoting both near-term reductions and the advancement of technology for larger future reductions over time.

Enbridge is prepared to work with all levels of government and key associations to encourage the energy industry to be a proactive participant in the development and implementation of climate change solutions.

Our approach has been to:

Build the Foundation

- Develop and implement an enterprise-wide plan including an internal GHG reporting system that ensures we understand the sources, types and magnitude of all GHG emissions within our operations.
- Identify, implement, and monitor the success of GHG reduction within our operations.

Lead by Example

- Set GHG performance improvement targets and publicly report on our progress in achieving these targets.
- Invest in alternative and renewable energy sources to assist our business and our customers in reducing GHGs.
- Look for opportunities to educate the public and our employees about climate change and what we are doing about it.

Work with Others

- Collaborate with key industry associations and non-government organizations to assist governments in establishing clear, economically sound rules to reduce GHGs and to conduct research and deploy new GHG reduction technologies where appropriate.
- Share information on current and emerging "best-available technologies economically achievable" and partner with key stakeholders to ensure governments are aware of, and understand, these technologies.
