When we decommission a pipeline, we continue to look after it. Landowners are not responsible for Enbridge’s decommissioned pipelines—we are.

Decommissioning, step by step

Before we decommission a line, we perform engineering and environmental assessments in consultation with landowners. And once the CER approves a decommission application, the process generally involves:

• Removing the vast majority of crude oil from the line;
• Wiping and cleaning the pipeline’s interior to remove all the crude oil;
• Physically disconnecting the pipeline from our system;
• Sealing it off from active operational facilities; and
• Segmenting the line, where necessary, to prevent it from acting as a water conduit.

Avoiding soil disturbance

Removing replaced sections of pipe entails major construction activities and disturbance to farmlands, neighbourhoods, roadways, wetlands, and green spaces, which we prefer to avoid whenever possible.

By leaving a decommissioned pipeline in place, we avoid the added disturbance and significant construction activities that excavation and removal would bring. Leaving the line in the ground also reduces the risk of soil and slope instability, settlement, and compaction issues that could compromise the safety of active pipelines sharing that right-of-way.

A long-lived load-bearing structure

A decommissioned pipeline will have a very long remaining life as a load-bearing structure for supporting soil and surface loads.

Independent engineering research and analysis suggests the rate of corrosion would be extremely slow, and occur over many centuries. This research also suggests that any associated changes to the land surface would be gradual; and that the maximum estimated surface change, after many centuries, would be a depression no deeper than the length of a ballpoint pen, about eight metres across.

Looking after the line

We remain responsible for our decommissioned pipelines. We monitor decommissioned lines, just as we do with active lines, in various ways:

• Maintaining cathodic protection (an electrical current that curbs corrosion);
• Right-of-way monitoring and maintenance;
• Depth-of-cover surveys;
• Maintaining signage and contact info; and
• Maintaining the line’s profile for Call/Click Before You Dig programs.
