

Maintaining safe & reliable access to North American crude oil

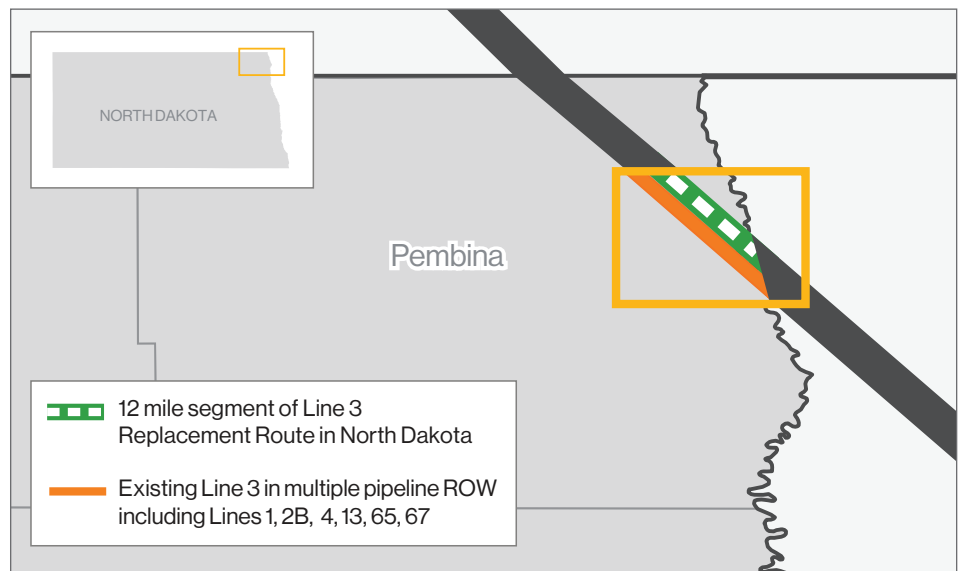

Line 3 Replacement Project North Dakota

Crude oil is refined into products we all use every day.

Enbridge has been transporting North American crude oil to U.S. refineries through underground pipelines for decades – safely and reliably. The safe operation and maintenance of our pipelines is Enbridge’s top priority.

Line 3 was originally put into service in 1968. Due to increasing repairs and disruptions to landowners and the environment, Enbridge looked to replacing the line with a privately funded investment of \$69 million in the state of North Dakota for the 12-mile segment. That replacement work started in August and is completing in October of 2020 with the support of all impacted landowners and local leaders.

In addition to safety as a maintenance project, this project has provided economic benefits in terms of construction jobs, purchase of local services and supplies, and through increased tax contributions.

Line 3 Replacement Project – Pembina County, ND

Ownership:
Enbridge Energy, Limited Partnership

Timing of construction:
August to October 2020

Line 3 Replacement:
36-inch diameter pipeline

Project:
\$69 million private invest in North Dakota

Length:
12 miles in North Dakota

400 workers at the height of construction.
