

# Restoration

- Enbridge meets with landowners to reach agreement on property-specific items that will be addressed during and after construction.
- Landowners will be notified prior to access or work on their property.
- During construction, Enbridge will use modern land restoration techniques to prevent soil erosion, protect agricultural topsoil, repair agricultural drain tiles and irrigation systems, and alleviate soil compaction.
- Enbridge will restore land to as close to preconstruction condition as possible, and minimize our long-term impacts to the land.
- Landowners will be contacted to confirm restoration was completed and/or that compensation was handled according to agreements with Enbridge.
